RESEARCH INTERESTS

I study whether the explanations that large language models give for their answers, in particular chain-of-thought reasoning, faithfully report what drove those answers, and how to measure and train such faithfulness. I build counterfactual and interpretability-based evaluations with proper baselines, and model organisms with known hidden influences as ground truth, toward trustworthy and auditable AI, especially in high-stakes domains. I am available for internships from May 2027 to August 2027.

EDUCATION

Northeastern University — Boston, MA

Ph.D. in Computer Science; Advisor: Prof. Byron C. Wallace — *Sept 2025 – May 2030 (expected)*

New York University — New York, NY

B.A. in Computer Science and Data Science, Minor in Mathematics; GPA 3.82/4.0 — *Sept 2020 – May 2024*

AWARDS & HONORS

- George Maker Research Scholar, New York University, 2023
- Dean's Undergraduate Research Fund Grant, New York University, 2023
- Dean's List for Academic Year, New York University, 2021–2022, 2022–2023, 2023–2024
- Cum Laude, New York University, 2024

RESEARCH EXPERIENCE

Faithfulness Beyond Counterfactual Simulatability [Ongoing] — Boston, MA

Northeastern University, Advisor: Prof. Byron C. Wallace — *Aug 2026 – Present*

- Built a model organism: Qwen3-4B fine-tuned to follow answer hints from 28 planted sources while verbalizing in its CoTs only the hint types that Counterfactual Simulation Training (CST) inserts.
- Showed that, in CST's setup, the organism scores 0.76 ± 0.01 on CST's simulatability score, the level CST's

authors reach after their own training, yet follows 94–99% of hidden hints and mentions them in about 2% of its CoTs; CST's own training raised the score (0.78 to 0.83) without reducing the hidden behavior.

Baselines and Metrics for Counterfactual Prompting [COLM 2026] Boston, MA

Northeastern University, Advisor: Prof. Byron C. Wallace *Oct 2025 – Aug 2026*

- Showed that counterfactual prompt edits are compound treatments: on MedQA, changing patient gender flips answers 14.9% of the time, statistically indistinguishable from the 14.1% from paraphrasing alone.
- Proposed an edit-length-matched paraphrase baseline with statistical testing: only 5 of 120 tests of MedPerturb's reported demographic and stylistic effects stay significant against it, while directional gender bias in Bias-in-Bios is detected even when small; per-sample metrics (JSD, KL) prove far more powerful than aggregate ones (MI, φ, flip rate). Released the cfprompt Python package.

Which Influences Do Reasoning Models Admit? [Ongoing] Boston, MA

Northeastern University, Advisor: Prof. Byron C. Wallace *May 2026 – Present*

- Designed eight answer hints that vary one property at a time (source legitimacy, or the act performed, such as bribe or threat) and ran them on DeepSeek-R1-Distill-Llama-70B: a hint's source (peer-reviewed study vs leaked answer key) does not change how often the CoT admits it (0.82–0.88), but the kind of hint does, fourfold (professor 0.88, bribe 0.22); inappropriate hints are followed and admitted less.
- Found that hint wording alone swings measured faithfulness from 14% to 100%, and that in about 1 in 10 generations the answer is not decided in the CoT and cannot be explained from it alone.

Language-Supervised Vision Models and Efficient Multimodal LLMs New York, NY

NYU VisionX Lab, Advisor: Prof. Saining Xie *July 2024 – June 2025*

- **Self-improving vision representations:** an MLLM generates billion-scale VQA data to train its own vision encoder, for better vision representations and task generalizability than CLIP; built an open-vocabulary detection pipeline (OwlViTv2, RAM++) for VQA generation and pretrained ViT baselines with PaliGemma and Cambrian on DataComp-Recap.
- **Efficient MLLMs:** investigated vision-token compression (Token Merging) and model merging (RegMean) to compress MLLMs for efficient on-device inference; migrated the Cambrian codebase from TPU to GPU.
- **Cambrian-S (ICLR 2026):** co-authored; led model evaluation across its benchmarks and datasets.

Safety, Training, and Evaluation of Medical Language Models New York, NY

NYU Langone OLAB, Advisors: Prof. Eric K. Oermann; Prof. Kyunghyun Cho *June 2022 – July 2024*

- **Data poisoning (Nature Medicine, 2025):** replacing only 0.001% of pretraining tokens with medical misinformation significantly increases harmful outputs while leaving performance on medical benchmarks unchanged, so the attack is undetectable; built a validation method using named-entity recognition and vector-similarity search on biomedical knowledge graphs that catches 91.9% of harmful content.
- **Pretraining dynamics:** toward a trustworthy medical LLM, built a LitGPT/PyTorch Lightning framework and trained multiple 1B models on Starcoder, PubMed abstracts, and SlimPajama mixtures to measure how data mix affects downstream performance; in-domain PubMed data improves clinical fine-tuning.
- **Neurosurgical benchmark:** built a multiple-choice benchmark from two neurosurgical board-exam datasets; most state-of-the-art LLMs score up to 42% lower on it than on five general medical QA datasets.
- **ICD-9 code assignment (ACL 2023 SRW, first author):** predicting diagnosis and procedure codes from clinical text; proposed a prior from correlations between ICD-9 and other medical codes, passively (training on two other code types) and actively (a loss regularizer), which improves performance on specific codes.

SERVICE

Reviewer: ICLR 2025, 2026; COLM 2026; NeurIPS 2026 (Evaluations and Datasets Track)

SKILLS

Python, PyTorch, JAX, TensorFlow, Hugging Face, Java, C, C++; LLM post-training (SFT, DPO, RL, LoRA); multi-node GPU training & inference; interpretability (TransformerLens, NNsight, SAEs, probing, J-lens)
